Make the switch.

Introducing SwitchArmor.[®]

Use less, less often.

SWITCH PLATE LUBRICANT

Whitmore Rail is proud to introduce SwitchArmor. This innovative product is the result of extensive research and testing. It is a dry film lubricant specifically developed for use on rail switches and turnouts.

Applying SwitchArmor is similar to applying paint. Simply apply a thin coat to the dry switch plate using a narrow brush or paint roller on a long handle. For even greater convenience, SwitchArmor is also available as an aerosol spray that can be applied using a Whitmore Trigger Applicator.

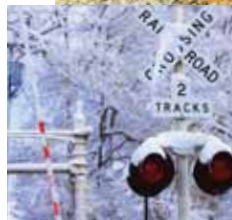

SwitchArmor dries quickly to form a film of graphite which is impervious to rain. The coating does not allow grit to adhere and accumulate over time. As the switch is thrown, the dry graphite film is burnished into the surface of the metal to form a smooth silver-colored contact area with a low coefficient of friction.

SwitchArmor is economical because very little is applied, and it lasts a long time. After the film has dried, there is no further evaporation. With conventional oil or grease type lubricants there is continuous evaporation of oil.

- **ECONOMICAL**
- **RESISTS DIRT AND WATER**
- **LESS WASTE**
- **EASY TO USE**
- **QUICK DRYING**
